

How to calculate solar panel output voltage?

If you know the number of PV cells in a solar panel, you can, by using 0.58V per PV cell voltage, calculate the total solar panel output voltage for a 36-cell panel, for example. You only need to sum up all the voltages of the individual photovoltaic cells (since they are wired in series, instead of wires in parallel). Here is this calculation:

How many volts is a 36 cell solar panel?

36-Cell Solar Panel Output Voltage =  $36 \times 0.58V = 20.88V$  What is especially confusing, however, is that this 36-cell solar panel will usually have a nominal voltage rating of 12V. Despite the output voltage being 18.56 volts, we still consider this a 12-volt solar panel.

What is the voltage of a solar panel?

The open circuit voltage of solar panels ranges between 21.7V to 43.2V. You can measure it by connecting a multimeter on no load. It is also mentioned at the back of the solar panel VOC. The maximum power voltage varies a lot because of the solar irradiance and connected load.

What voltage is a 12V solar panel?

Example: A nominal 12V voltage solar panel has an open circuit voltage of 20.88V. This sounds a bit weird, but it's really not. Voltage output directly from solar panels can be significantly higher than the voltage from the controller to the battery. Maximum Power Voltage (Vmp).
