

But our research indicates that structural challenges and strong signal from Beijing will be necessary to start a "going out" trend in wind and solar investment.

China's 13th Five-Year Plan for Solar Energy Development contained specific goals for solar technology innovation, including commercialized monocrystalline silicon cells with an efficiency of at least 23% ...

Beijing has long outlined big ambitions for its green transition. But environmentalists inside and outside China remain sceptical that the country will ever shake its addiction to coal.

China's PV industry has established a preliminary policy system. Industrial policy is lagged compared with the market development. Reducing carbon footprint of PV products is critical for policy ...

Because of such a remarkable policy environment, by 2023, more than 95 percent of new utility-scale solar PV panel installations and onshore wind turbines had lower electricity generation costs than ...

Chinese officials want homeowners to install solar panels to combat overcapacity, but China's grid is still not able to accommodate fluctuating solar energy levels, as Semafor previously ...

China's solar ambitions are emblematic of its broader race toward a green energy future, driven in part by Beijing's interest in becoming less reliant on imported oil and natural gas.

It leads almost every segment of the clean-energy economy, from solar and wind to batteries, electric vehicles and grid technology. Its decisions now influence global cost structures, ...

Between 2010 and 2024, the country executed an ambitious strategy that combined massive state investment, ruthless economies of scale, technological innovation, and strategic ...

The plan was published by the State-owned Assets Supervision and Administration Commission of Beijing, which regulate the city's SOEs. It details 25 measures that aim to establish a green industry ...
