

Can peak shaving reduce energy costs?

Modern consumers actively seek cost-effective energy solutions and sustainable practices. This white paper explores peak shaving as an effective method to minimize energy costs. Energy and facility managers will gain valuable insights into how peak shaving applications can help unlock the full potential of energy storage systems.

What is peak shaving?

Peak shaving involves selectively transferring specific loads within a facility from the grid to an energy storage system. This process is accomplished by disconnecting the power supply of a specific load(s) from Source A (typically the grid) and connecting them to Source B (an energy storage system).

Does peak shaving a battery save money?

According to the results obtained in this study, more than the economic savings achieved by the peak shaving operation of the storage system is needed to compensate for the battery investment, considering the typical costs of industrial battery storage.

Why is peak shaving Better Than Load shifting?

Load shifting allows for demand flexibility without compromising continuity. However, peak shaving offers continuity and peak load reduction by storing energy off-peak for later discharge on a peak, thus lessening capacity charges while also providing an opportunity for energy arbitrage.
