

The state has successively subsidized the use of clean energy for heating and a series of policies aimed at improving the quality of life of residents and at the same time achieving the effect of low-carbon emission ...

The system stores heat energy in the low valley period of urban electricity at night in an electric heating mode. High-temperature high-pressure steam is generated in a flash evaporation and...

Compared to the reference heating alternatives, i.e., natural gas and solar heating for decentralized systems, only pit and low-temperature aquifer thermal energy storage is economically competitive.

This article explores how these technologies drive efficiency across renewable energy, industrial operations, and residential applications - all while addressing the urgent need for decarbonization.

The energy efficiencies of the three heating modes were 48.59 % for direct solar heating, 96.46 % for a GSHP heating mode, and 97.95 % for solar assisted heat pump heating, with the GSHP heating mode having the ...

Groundwater from wells spread across the northern half of the 45-hectare development will be drawn by high-efficiency electric heat pumps, powered in part by solar panels, to provide low-cost...

The study aims to explore the potential of Underground Thermal Energy Storage (UTES) systems, including Aquifer Thermal Energy Storage (ATES) and Borehole Thermal Energy Storage

While in a hot storage system, the heat is added to the medium - that is, the temperature increment, the heat is removed from the cold storage, thereby reducing the temperature.

The study aims to explore the potential of Underground Thermal Energy Storage (UTES) systems, including Aquifer Thermal Energy Storage (ATES) and Borehole Thermal Energy Storage (BTES), as sustainable ...

The system works without external heat sources, and utilizes an air compressor, a compressed air reservoir with a built-in thermal energy storage system, and an air expander. [pdf]
