

There are 63 ongoing projects in 2024, including 24 new projects. In the research field of wind energy, the research on applied basic scientific issues, such as wind turbine blades, large ...

Since 1990, the National Renewable Energy Laboratory's (NREL's) National Wind Technology Center (NWTC) has tested more than 150 wind turbine blades. NWTC researchers can test full-scale and ...

This manuscript delves into the transformative advancements in wind turbine blade technology, emphasizing the integration of innovative materials, dynamic aerodynamic designs, and ...

With over 40 years of innovation that continues to shape the wind industry, LM Wind Power is a pioneer in advancing wind turbine blade technology and setting new standards for sustainability, efficiency, ...

Since 1989, Sandia has partnered with Montana State University to test and analyze mechanical properties and trends of fiber-reinforced polymers (composites) and other materials used to construct ...

Researchers see a realistic path forward to the manufacture of bio-derivable wind blades that can be chemically recycled and the components reused, ending the practice of old blades ...

In 2012, two wind turbine blade innovations made wind power a higher performing, more cost-effective, and reliable source of electricity: a blade that can twist while it bends and blade airfoils ...

Overall, DOE funding in testing facilities for turbine blades and drivetrain components--along with the research enabled by these facilities--have provided knowledge and ...

We provide authoritative research and analysis on the wind power industry to countries all over the world. We work with governments to give them transparent information about the benefits and ...

A team of National Renewable Energy Laboratory (NREL) researchers are furthering their revolutionary combination of recyclable thermoplastics and additive manufacturing (better known as ...
