

Your first problem is your battery is dead. A fully charged battery should be 12.6 volts. 11 volts under load has gone beyond completely discharged. Unless your charge controller has a load ...

Are you concerned that the solar panel voltage drops under a load? Unfortunately, it is not an uncommon problem with solar arrays, and inside we go through some troubleshooting options ...

Decode solar panels specifications to safely connect your panels to power station or charge controller. This quick guide unlocks full solar potential.

Do this when the controller is charging and when it is not charging. They should all be the same when not charging and within a few fractions of a volt when charging.

The reason is because you are using a PWM charge controller. It doesn't have any way to alter the voltage so it simply connects the PV to the battery (it does this rapidly but so fast that it is effectively ...

This can be done by altering the panel's wiring configuration, using an MPPT charge controller or a step-down converter, or reconfiguring the connection points within the solar panel's junction box.

Sorry, you're not going to run your clothes dryer off that kit. Go grab any other 100w solar panel available, wire it into the controller, and you'll be getting more power than those thin panels ...

The solar panel low voltage problem is due to environmental issues, damaged wiring, and defective equipment.

Discover how to choose the right size solar panel to effectively charge a 12-volt battery in this comprehensive guide. Learn about crucial factors like battery capacity, charging ...

We have explained what solar panel voltage is and how you can calculate it. Learning about different solar panel voltages and the factors affecting them will help in better understanding ...
