

Solar-powered aircraft are electric aircraft that can be an airplane, blimp, or airship and use either a battery or hydrogen to store the energy produced by the solar cells and use that energy at night when the sun isn't shining.

In this article we will review a study examining methods to reduce the impact of on-airfield solar upon aircraft and facilitate more renewable energy generation.

Solar-powered aircraft represent a striking advancement in aviation technology, heralding a new era of sustainable flight. These innovative vehicles harness the power of the sun through ...

This paper contributes to this effort by presenting an analysis framework and a detailed case study for integrating an auxiliary solar power system for air taxi operations.

By utilizing solar technology, aircraft carriers can generate onboard power, allowing for a diminished reliance on traditional fuel sources. This shift leads to cost savings, as solar energy is a ...

In the context of aviation, solar energy can be harnessed using photovoltaic cells, commonly known as solar panels, which convert sunlight into electricity. Solar-powered aircraft utilize ...

At Airbus, we are working to use this alternative renewable energy source to power high-endurance stratospheric flight. Our advances in solar cell technology enable unmanned aerial vehicles to stay ...

Unlike conventional aircraft, solar-powered aircraft use photovoltaic panels to collect solar irradiance and convert it into electrical energy. Solar-powered aircraft have a huge potential for ...

This paper describes an integrated power model for a solar-powered, computationally-intensive unmanned aircraft that includes power models for solar generation, aircraft propulsion, and avionics.

This study focuses on the design and analysis of a Solar Power Plant system for application on a hybrid airship used for cargo transportation.
