

This guide provides information about the importance of wind tunnel tests in assessing the aerodynamic stability of solar tracker systems. Read more to understand more about wind tunnel tests for ...

Based on wind tunnel test data under 305 different working conditions, the variation laws of the wind pressure coefficient, power spectral density, and wind load coefficient of the heliostat and concentrator ...

The comparison between wind-tunnel and 2-d CFD results (especially $WD = 0^\circ$;) in this figure suggests that the flow field over and inside PV tile arrays may be influenced by three dimensional effects.

Wind tunnel studies typically define their limitations in their reports. These limitations usually address the geometry of both the PV array (tilt angle, height, etc.) and the building (height, size, shape, etc.).

This paper discuss the difficulties of the wind load design for the PV power plants ground mounted in Romania and compares the Romanian, German, European and American wind design code...

We develop scaled models placed in the wind tunnel to determine the underlying aerodynamic coefficients, then combine this data with an analysis of the regional wind climate, which is unique to the ...

Utilizing a series of wind tunnel experiments on a photovoltaic array comprising four equally sized panels, this study assessed how variations in tilt angle, mounting height, spacing, and...

Below is a list of few of the geometric parameters where attention should be given while preparing the wind tunnel pressure models of the ground mounted racking systems.

This study investigated the flow field characteristics of PV arrays under nine different wind direction angles and four wind speed gradients using wind tunnel experiments.

Contact CPP Wind today to ensure that the effects of wind and airflow are incorporated in your design.
